

Deployment

Introduction

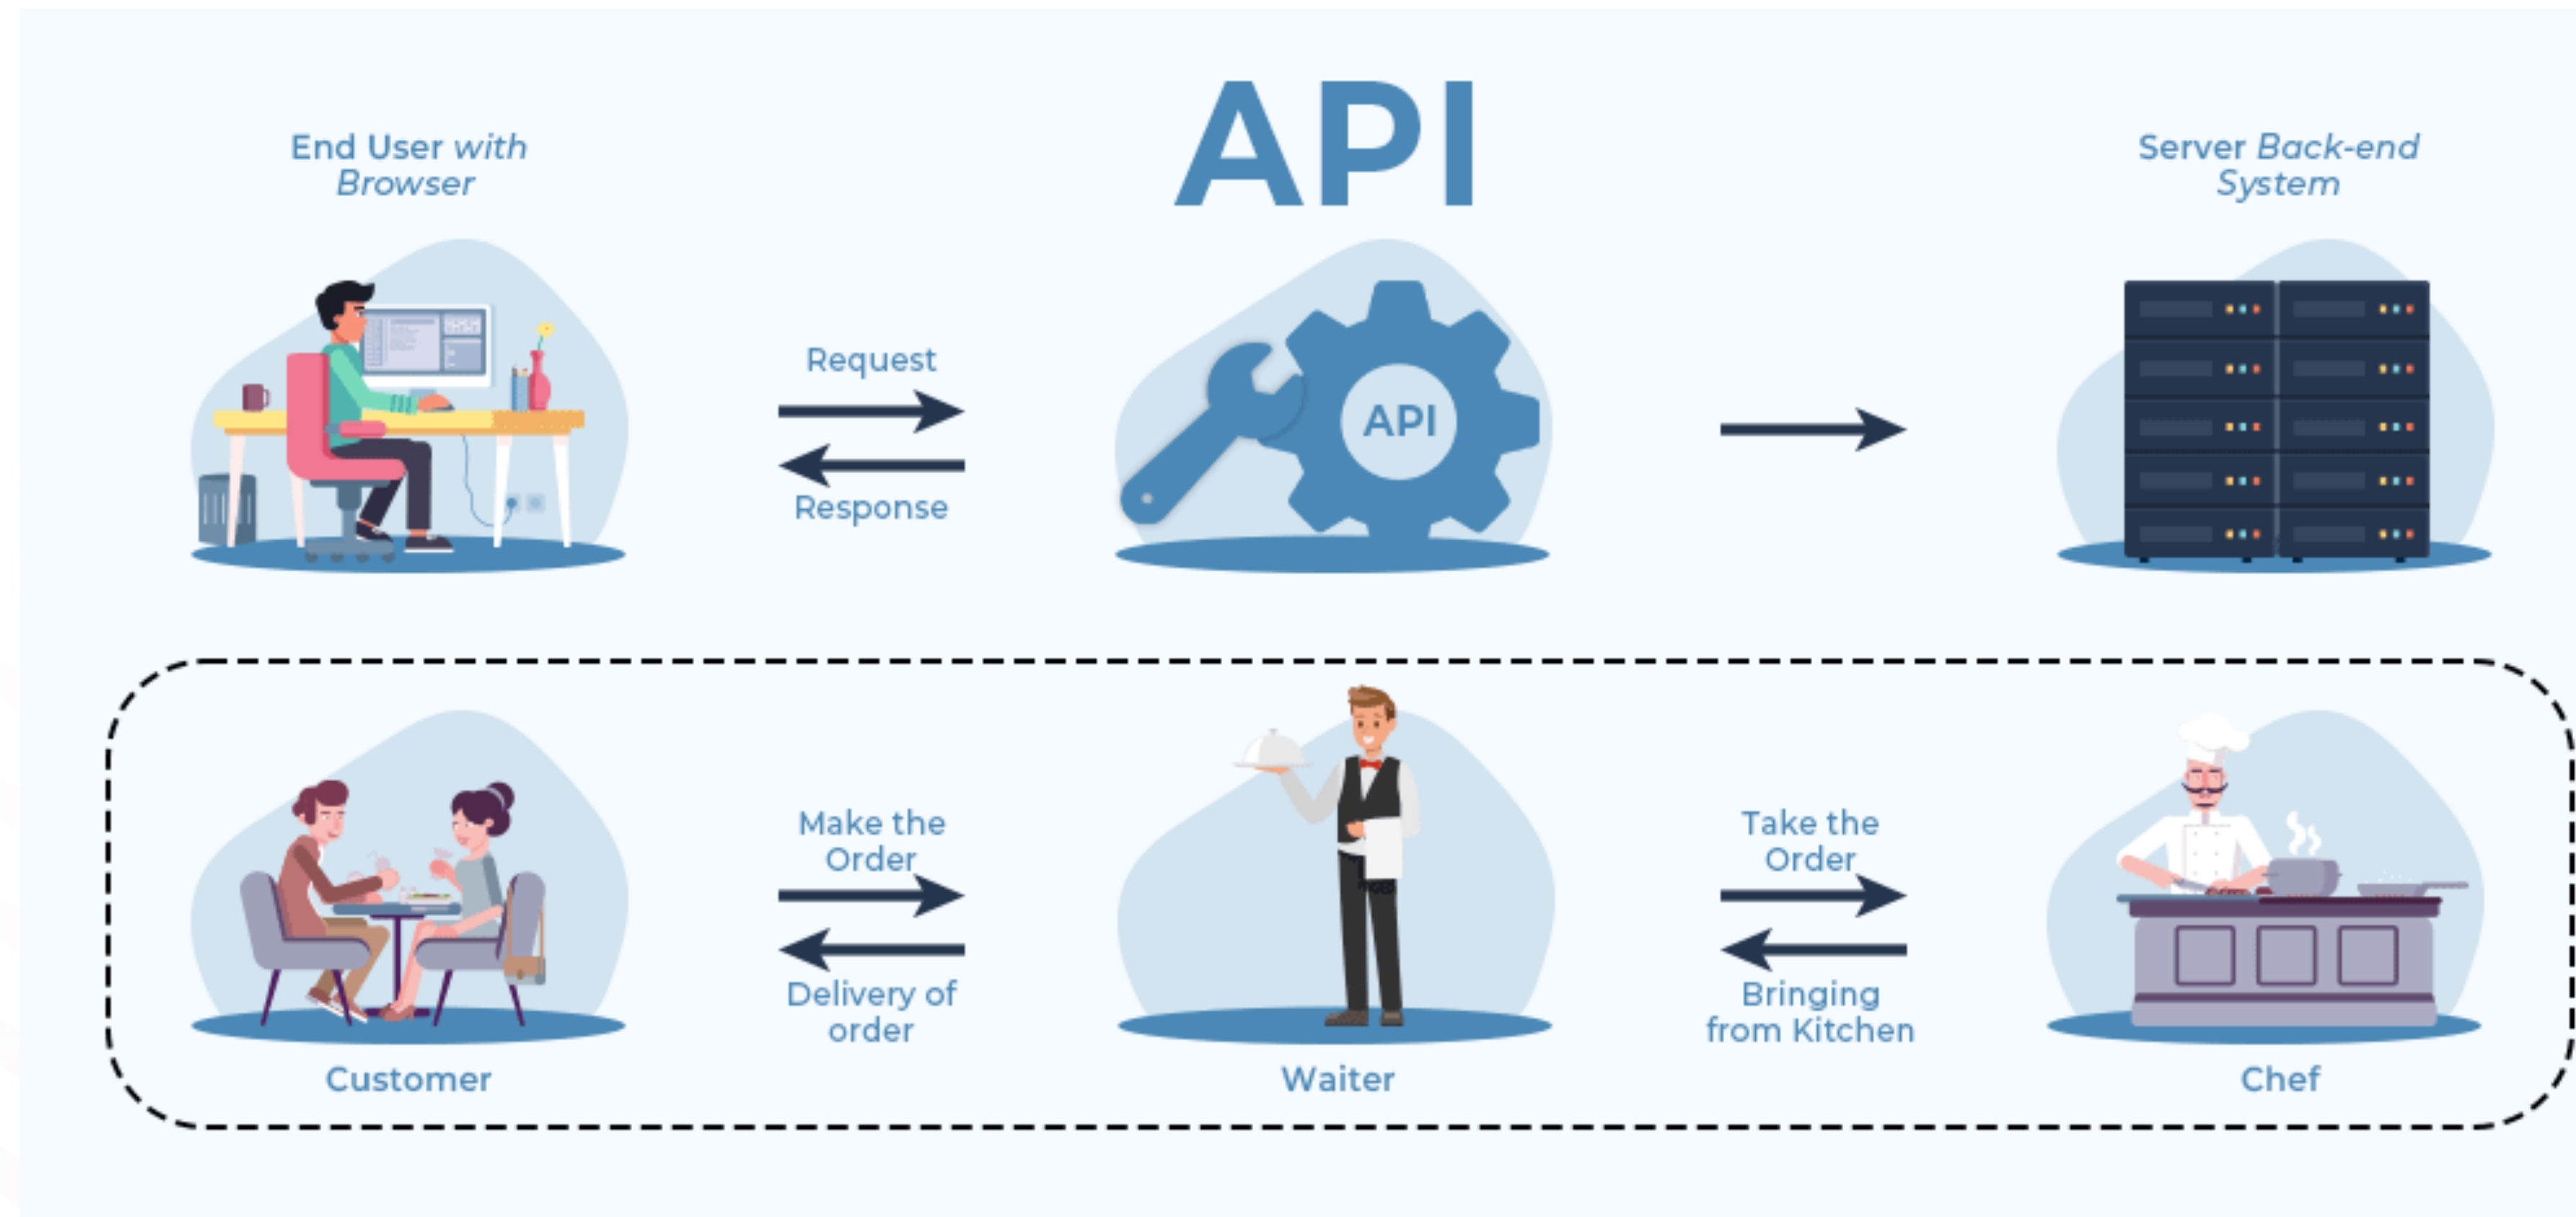

1- Deploying machine learning models is crucial for putting them into real-world applications.

In this presentation, we'll explore the deployment process using three popular Python frameworks: FastAPI, Flask, and Django.

What is API?

- **Definition:** A set of rules and protocols facilitating communication between software applications.
- **Purpose:**
 - Enables seamless interaction between different systems.
 - Allows developers to access the functionality of a service without understanding its internal workings.
- **Types:**
 - **Web APIs:** Use HTTP for communication (e.g., RESTful APIs).
 - **Library-based APIs:** Provide functions for specific tasks.
 - **Operating System APIs:** Enable interaction with the underlying OS.

What is API?

Which Better? FastAPI, Flask, Django

Aspect	FastAPI	Flask	Django
Framework	Asynchronous	Asynchronous	Asynchronous
Preformance	Fast	Lightweight	Moderate
Documentation	Automatic OpenAPI	Well-documented	Comprehensive
Flexibility	High	High	Moderate
Ease of Use	Easy	Easy	Moderate
Community	Growing	Large	Very Large

Synchronous Vs Asynchronous

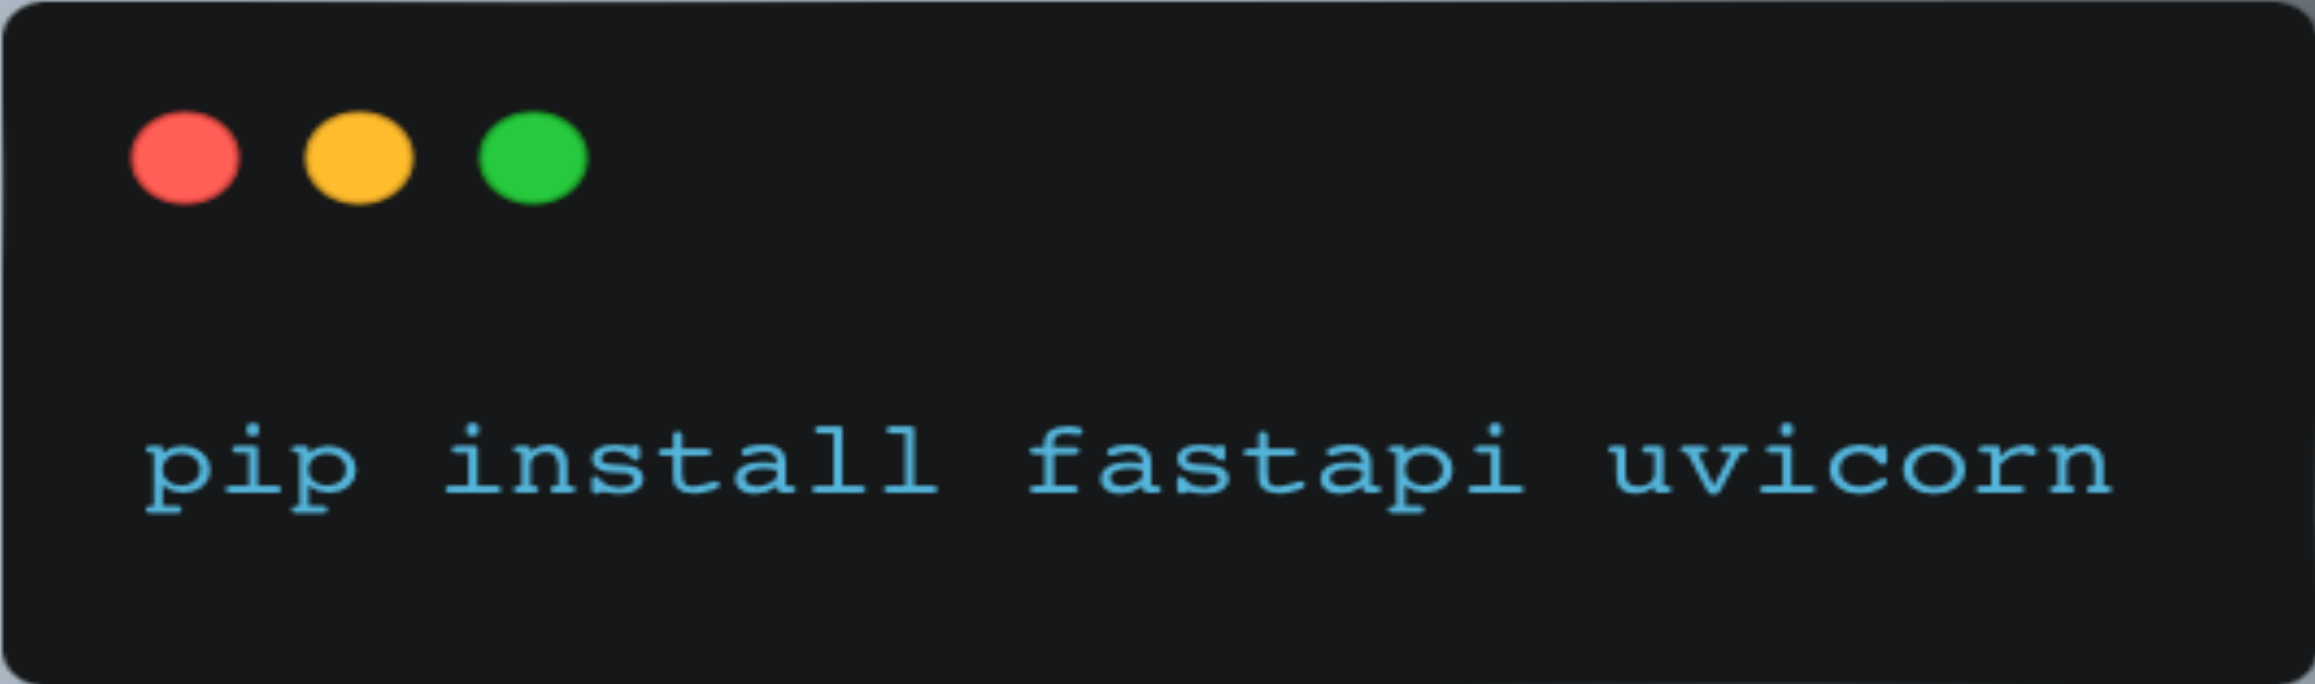

What would we choose?

 FastAPI

Required Libraries

- FastAPI
- Uvicorn

A terminal window with a black background and three colored window control buttons (red, yellow, green) in the top left corner.

```
pip install fastapi uvicorn
```

Required Environment

- Model file (e.g., .h5 for Keras, .pkl for scikit-learn ..etc), the file contains the weights and parameters of your trained model.
- Preprocessing Script (If Applied)

Publishing on a Server

- Deploying your machine learning model onto a server is crucial for making it accessible over the internet.
- This section covers the process of publishing your model, enabling users or applications to interact with it remotely.

Hosting Services

- Alibaba cloud (SCCC)
- Amazon Web Services (AWS)
- Google Cloud
- Azure
- Heroku
- Render
- Digital Ocean
